## Lecture - 6

### # Operations on signals :-

\* In general, we can vary two parameters, i.e. —

- ① Amplitude
- ② Time

\* Operations that can be performed on amplitude are —

- ① Scaling
- ② Addition
- ③ Subtraction
- ④ Multiplication

\* Operations that can be performed on time are —

- ① Shifting
- ② Scaling
- ③ Reversal

Let us take an example,

$$x(t) = A \cos t$$

,  $A \rightarrow$  amplitude  
 $t \rightarrow$  time.

### ① Time Shifting :-

$$x(t) \longrightarrow x(t - t_0)$$

ve shift

shift in 'right' dir<sup>n</sup>

$$x(t) \longrightarrow x(t + t_0)$$

-ve shift

shift towards left.

(16)

Ex.

Time period = 4

If its given  $x(t-2)$ 

shifts two positions right

T.P = 4If  $x(t+2)$  then shift left,T.P = 4

So, we are not changing the time period.

Time period :- One complete cycle of vibration to pass a given point.

## ② Time scaling :-

In time scaling, we are going to change the time period also.

$$x(t) \longrightarrow x(at), \quad a \text{ is always } +ve$$

$|a| > 1 \longrightarrow$  Compression of signal

$|a| < 1 \longrightarrow$  Expansion of signal

Ex. :-

T.P = 4

\* To do time scaling, divid T.P. by 'a'

Let  $a = 2$ 

T.P. = 2

Compressed.

Let  $a = \frac{1}{2}$

N.B. Unit step s/g do not have time scaling.

### ③ Time reversal :-

This is just the mirror image of the s/g.

$$\boxed{x(t) \rightarrow x(-t)}$$

Eg:

### # Amplitude Related Operations :-

#### ① Scaling :-

$$y(t) = c \cdot x(t)$$

Ex.  $x(t) = 4 \cos t$ . Then what is the value of  $y(t) = 2x(t)$ ?

$$\begin{aligned} \rightarrow y(t) &= 2x(t) \\ &= 2 \cdot 4 \cos t \\ &= 8 \cos t \end{aligned}$$

18

## ② Addition :-

$$x_3(t) = x_1(t) + x_2(t)$$

[Add<sup>n</sup> of amplitudes  
of two signals]

## ③ Subtraction :-

$$x_4(t) = x_1(t) - x_2(t)$$

## ④ Multiplication :-

$$x_5(t) = x_1(t) \times x_2(t)$$

\* Law of precedence

- ① Shifting
- ② Scaling.

Q: Given,  $x(t)$ . Plot  $x(-2t+3)$ ,  $x(t/2-1)$

Sol<sup>n</sup>:-

For  $x(-2t+3)$

-ve shifted by '3'

→

Scaling by 2  
so, dividing by 2.

→

Reflection

For  $x(t/2-1)$

pos shifted by '1'

→

Scaling by  $1/2$   
i.e. dividing by  $1/2$
